Minsk, Belarus · open to relocation / remote

Frontend engineer with 8 years in React and TypeScript, comfortable taking a product's frontend from an empty file to production and owning it end to end. A short walk through what I have built and how I work.

FEATURED PROJECT

Rideo — SaaS for ride-hailing fleet partners

Sole Frontend Engineer · 2025 – Present

Rideo helps Uber, Bolt and Free Now fleet partners run their business without spreadsheets: driver records and documents, vehicle assignments, fuel cards, payouts and automated VAT/ZUS settlement. I'm the sole frontend engineer on a small cross-functional team (backend, design, QA, product owner) and own the whole frontend: architecture, features, UX and deployment. Live in production for a launch partner and now being productized for sale.

5+ h → under 2 h

weekly settlement, previously manual in Excel

~22k lines

of TypeScript / React app code (AI-assisted)

100+ / 20+

components and screens shipped

3 languages

EN / PL / RU, ~600 keys

84 + 17

unit tests and e2e scenarios

14 modules

typed API auto-generated from OpenAPI

WHAT I BUILT

- Architecture and build AI-first (Cursor and Claude Code, reviewing every diff): feature-based structure, Redux Toolkit for client state and TanStack Query for server state.
- A fully typed API layer generated with Orval from the backend OpenAPI schema, plus a custom fetch layer (JWT, CSRF, 401 handling, centralized feedback).
- Bulk Excel import flows with client-side parsing and validation, and data-heavy grids tuned for speed.

HIGHLIGHTS

- Turned a 5+ hour manual settlement into a 20-minute-to-2-hour automated flow.
- Localization for three languages with detection and per-request language headers.
- Quality owned end to end: Jest/RTL, two Cypress suites (mocked + live), versioned releases and frontend deployment; installable PWA with Clarity and GA4.

STACK

React 19

TypeScript

Redux Toolkit

TanStack Query

MUI + X Data Grid

React Hook Form

Orval

i18next

Cypress

RTL

PWA

Weekly settlement report — per-driver balances across Uber, Bolt and Free Now, VAT and rent in one view.

Two-step flow to assign a car to a driver with dates.

Per-service settings for Uber, Bolt and Free Now.

Import pipeline for platform and fuel reports (Excel).

Weekly grid for manual payments and debt tracking.

SELECTED EXPERIENCE

LeverX — Frontend Developer

Nov 2023 – Dec 2025

Led frontend architecture in React/Next.js with SSR/ISR and set the team's coding, testing and review practices. Standardized server/client state with TanStack Query and Redux Toolkit, improved performance with code-splitting and caching, and built a reusable MUI/Radix component library with baseline WCAG accessibility.

React

Next.js

TypeScript

TanStack Query

Radix UI

Cypress

EPAM Systems — Frontend Developer

Apr 2022 – Oct 2023

Delivered React features end to end and modernized legacy code with a modular structure and stricter TypeScript. Sped up complex forms and tables with virtualization and memoization, introduced a clear testing pyramid, streamlined CI/CD, and added baseline security controls (CSP, XSS/CSRF).

- React
- TypeScript
- Redux Toolkit
- RxJS
- Azure DevOps

Earlier roles — MrSoft, Freelance, Elinext

2018 – 2022

Built a React + Apollo GraphQL UI for an electronic archives platform (predictable caching, reusable components), an e-commerce shop with catalog, cart/checkout and a 3D room preview, and admin screens integrated with Laravel APIs — where I first grew into clean architecture and shared tooling.

- React
- TypeScript
- Apollo GraphQL
- Redux
- SCSS
- Figma

HOW I WORK & CORE SKILLS

I ship fast without letting quality slide: typed contracts, a sensible test pyramid, and code review as a habit. I own an area end to end and work closely with backend, design and QA, turning product requirements into shipped, deployed features. I work AI-first in Cursor and Claude Code (agent mode for refactors, scaffolding and tests, kept on rails with project rules), but I read and diff every change and lean on TypeScript and tests to catch what the model gets wrong — architecture decisions stay human.

- TypeScript
- React / Next.js
- Angular
- Vue
