

Uladzislau Batashou

Senior Frontend Engineer • Minsk, Belarus (open to relocation / remote)

Email: batashof@gmail.com Phone: +375 25 763-06-95 LinkedIn: uladzislau-batashou-23462b155

Summary

Senior Frontend Engineer with 8+ years building React and TypeScript applications, from early-stage products to enterprise platforms. Currently the sole frontend engineer on Rideo, a SaaS for ride-hailing fleet partners, where I own the frontend end to end within a small cross-functional team (backend, design, QA and product): architecture, feature development, state and data layer, localization, testing and frontend deployment. I turn business and UX requirements into a usable interface, set frontend conventions, and keep performance and accessibility in check while shipping fast. I work AI-first in Cursor and Claude Code and treat model output as code to review, not to trust blindly.

Core Skills

- Languages: TypeScript, JavaScript (ES6+), HTML5, CSS/SCSS
- Frameworks: React (incl. 19), Next.js (SSR/ISR), Angular, Vue
- State & Data: Redux Toolkit, TanStack Query, Apollo GraphQL, NGRX, React Hook Form, RxJS
- APIs: REST, GraphQL, OpenAPI-driven codegen (Orval), WebSockets (Socket.io)
- UI: Material UI & MUI X Data Grid, Tailwind CSS, Radix UI, Emotion, Figma
- Quality: Jest, React Testing Library, Cypress; ESLint, Prettier
- Build & DevOps: Vite, Webpack, Git, CI/CD, Azure DevOps, Jira
- Practices: clean architecture, performance optimization, accessibility (WCAG), i18n/localization, PWA, code review, mentoring, Agile/Scrum
- AI-assisted development: Cursor (agent workflows, project rules, MCP), Claude Code, GitHub Copilot

AI-Assisted Development

- Cursor is my main IDE, used in agent mode for multi-file refactors, feature scaffolding and test generation, and I use Claude Code for agentic, terminal-driven tasks across the repo. I keep both on rails with project rules (AGENTS.md / .cursor) so output matches the codebase, and I read and diff every change, leaning on TypeScript and tests to catch hallucinated APIs.
- Comfortable with the practical side: scoping context, choosing the right model per task, and wiring MCP and codebase context. This speeds up the boilerplate (API bindings, i18n keys, tests) without handing over architecture decisions. Earlier used GitHub Copilot for inline completion.

Experience

Rideo — Frontend Engineer (sole frontend engineer)

Dec 2025 – Present · Remote

Stack: React 19, TypeScript, Material UI + MUI X Data Grid, Redux Toolkit, TanStack Query, React Hook Form, React Router, Orval, i18next, Cypress, RTL

- Sole frontend engineer on a small cross-functional team (backend, designer, QA, product owner) for a SaaS that lets Uber/Bolt/Free Now fleet partners manage drivers, vehicles, documents, fuel cards and payouts without spreadsheets. I own the frontend end to end and its deployment; the app is live in production running a launch partner's day-to-day operations and is now being productized for sale.
- Replaced a manual, spreadsheet-based weekly settlement process (5+ hours) with an automated flow that runs in 20 minutes to 2 hours, while covering roughly 5x more of the workflow than the old spreadsheets did.
- Designed the frontend architecture and built it AI-first in Cursor and Claude Code (reviewing and diffing every change): ~22k lines of TypeScript/React across 100+ components and 20+ screens, with Redux Toolkit for client state (12 slices: auth, permissions, filters, UI) and TanStack Query for server state.
- Generate a fully typed API layer with Orval from the backend OpenAPI schema (14 modules, ~15k lines), so client and server contracts stay in sync without hand-written bindings.
- Built a custom fetch layer around the generated client: JWT auth, CSRF, 401 handling with post-login redirect, and centralized loading/error/success feedback, so behavior stays consistent across the whole API surface.
- Implemented Polish tax specifics (VAT and ZUS, weekly and monthly), multi-tenant branch-office logic and bulk Excel imports (driver earnings, fuel transactions) with client-side parsing and validation; coordinate API contracts with backend, UX with the designer and coverage with QA, working from requirements with the product owner.
- Set up localization for three languages (EN/PL/RU, ~600 keys) with i18next, including language detection and per-request Accept-Language handling.

- Own quality end to end: 84 Jest/RTL specs and 17 Cypress e2e scenarios (mocked and live API), ESLint and Prettier with pre-commit hooks, and automated app versioning; track real usage with Microsoft Clarity and GA4 and ship an installable PWA.
- Tuned data-heavy grids and forms (virtualized MUI X Data Grid, memoization, debounced filters) and added client-side image compression for uploaded documents and avatars.

Domains: fleet/driver management, financial reporting, document workflows, multi-tenant SaaS.

LeverX — Frontend Developer

Nov 2023 – Dec 2025 · Minsk / Remote

Stack: React, TypeScript, Next.js, TanStack Query, Radix UI, Material UI, Vite/Webpack, Cypress, RTL, PWA

- Led frontend architecture in React/Next.js with SSR/ISR, and set the coding standards and review practices the team worked to.
- Standardized data handling with TanStack Query for server state and Redux Toolkit for client state, which cut a lot of ad-hoc code.
- Improved performance through code-splitting, lazy loading and HTTP/image caching, using bundle profiling to decide what was worth changing.
- Built a reusable component library on MUI/Radix with design tokens and baseline WCAG accessibility rules.
- Defined a practical testing strategy (Jest, RTL, Cypress) and added CI checks and PR quality gates.
- Worked closely with backend, design and product, unblocked the team, and mentored less experienced developers.

Domains: data-rich analytics, SEO-sensitive content, offline-ready PWAs, real-time messaging.

EPAM Systems — Frontend Developer

Apr 2022 – Oct 2023 · Minsk / Remote

Stack: React, TypeScript, Redux Toolkit, Material UI, RxJS, SCSS, Webpack, Azure DevOps

- Delivered features end to end: clarified scope, implemented, tested and shipped.
- Modernized legacy code by modularizing it, adding shared utilities and tightening TypeScript to reduce runtime issues.
- Made complex forms and tables faster with virtualization, memoization and debounced inputs.
- Introduced a clear testing pyramid and streamlined CI/CD to stabilize releases; added baseline security controls (CSP, XSS/CSRF).

Domains: operational dashboards, complex forms/tables, healthcare data workflows.

MrSoft — Frontend Developer

Mar 2020 – Mar 2022 · Minsk

Stack: React, TypeScript, Redux, Apollo GraphQL, SCSS, Azure DevOps

- Built a React + Apollo UI for an electronic archives platform with predictable caching and updates.
- Introduced reusable components and standardized tooling (linters, formatters) to speed up development, and simplified state flows to cut prop drilling.

Freelance — Frontend Developer (Contract)

Feb 2019 – Feb 2020 · Remote

Stack: React, TypeScript, React Hooks, SCSS, Git, Figma

- Delivered an online shop (catalog, cart/checkout, 3D room-preview) working closely with a designer in Figma and iterating quickly on layouts and component boundaries.

Elinext — Frontend Developer

May 2018 – Jan 2019 · Minsk

Stack: React, TypeScript, Bootstrap, SCSS, Redux, PHP (Laravel)

- Built key admin screens integrated with Laravel APIs, and organized the SCSS structure (variables, mixins, reusable patterns) to make changes safer and faster.

Education

Belarusian State University — Faculty of Mechanics and Mathematics

Web Application Development (Mathematician), 2013 – 2018

Certifications

- AWS Certified Cloud Practitioner (CLF-C01)

Languages

- English — Upper-Intermediate (B2); Russian and Belarusian — Native
